

Foundation design

In this section, you'll find technical guidance on foundation designs – for both the range of high masts in this brochure and bespoke masts designed by Abacus for specific clients' projects. All foundations meet BS8004 standards and comply with the Institute of Lighting Engineers' Technical Report No.7.

Allowable ground-bearing pressures

A key factor in determining the size of mast foundations is the bearing pressure of the ground in which it will sit.

Over the following pages, each standard foundation reference incorporates the ground-bearing pressure within its code, making it quick and simple to identify the kind of foundation you need. The table below shows subsoil classifications according to the BS8004 standard, against the approximate allowable bearing pressure. We're also working to the new eurocodes,

If there is any doubt over ground conditions, it is the client's or contractor's responsibility to consult a qualified civil engineer to establish the true bearing pressures.

Typical foundation details are provided for guidance only and should be checked with the client before use. Abacus Lighting Limited will not accept responsibility for any foundations unless they are specifically designed by us at the client's request.

Types of subsoil

| Types of subsoil | Condition of subsoil | Field test applicable | Approximate allowance bearing pressure kN/m ² |
|--|--|---|---|
| Rock | Not inferior to sandstone, limestone or firm chalk | Requires at least a pneumatic or other mechanically operated pick for excavation | 1000 |
| Gravel, sand | Compact | Requires pick for excavation. Wooden peg 50mm ² in cross section is hard to drive beyond 150mm | Dense to very dense 150-400 Loose to medium dense 50-250 |
| Clay, sandy clay | Firm | Can be moulded by substantial pressure with the fingers and excavated with graft or spade | 50-100 |
| Sand*, silty sand*, clayey sand* | Loose | Can be excavated with a spade. Wooden peg 50mm ² in cross section can be easily driven | <75 |
| Silt*, clay*, sandy clay*, silty clay* | Soft | Fairly easily moulded with the fingers and readily excavated | <75 |
| Silt*, clay*, sandy clay*, silty clay* | Very soft | Natural sample in winter conditions exudes between fingers when squeezed in fist | <75 |

These values are provided for guidance only. If in any doubt, consult a qualified civil engineer. *Foundations on these soils require assessment and design by a qualified civil engineer.

Planning the site: cable trenches

Cables buried directly in the ground must be marked by cable covers or a suitable marking tape.

Cables, conduits and ducts must be buried deep enough to avoid damage from any reasonably foreseeable ground disturbance. If you are in any doubt, refer to national guidelines or standards. **Typical cable trench**

Foundations and flange plates

The principal method for installing a high mast involves a flange plate supported by a prepared foundation*.

The flange plate, which is welded to the base of the mast, is designed to accommodate the overturning moments (forces) for each specific mast. Bolt holes in the flange plate are arranged in one of two ways:

- 1. In a square, where the stated 'bolt centre' dimension is given.
- 2. In a circle, where the 'pitch circle diameter' (PCD), is given.

This diameter is stated for the dimension between bolt-hole centres (see diagram).

*Root-mounting can be an option up to a height of 18m, but we don't cover this here. If you'd like more information on this method, please contact the Abacus sales office.

Square bolt configuration, with bolt centre dimensions

Circular bolt configuration, with PCD bolt centre dimensions

Assembling foundation bolts into concrete

Foundation bolts

Foundation bolts are supplied with nuts, washers, a spacer plate and a fixing template in either wood (smaller masts) or steel. Make sure the foundation bolt is put together accurately with bolts vertical and fixed rigidly so it won't be displaced or misaligned during concreting. Also, check that bolts project correctly above the foundation.

After the concrete has cured, the mast is erected and levelled on the double nuts.

The bolts should then be tightened in accordance with the final torque value, as shown in the table to the right.

Concrete

Foundations should be constructed in accordance with the following design and dimensional details. Unless otherwise specified, they should use:

- For reinforced foundations: grade C28/35 concrete and high tensile reinforcement with a yield stress of 485N/mm²
- For unreinforced foundations: C20/25 grade concrete.

Cable entry ducts should be placed centrally within the concrete to facilitate entry into (and in some cases out of) the mast itself.

Concrete will typically take a minimum of 14 days to cure – enough to erect the mast subject to various factors and in accordance with recommendations.

Holding-down bolt projection and final torque values

| Bolt size and grade | Projection (mm) | Torque (Nm) |
|-------------------------|-----------------|-------------|
| M16*500 long grade 4.6 | 125 | 25 |
| M20*500 long grade 4.6 | 125 | 50 |
| M24*600 long grade 4.6 | 125 | 160 |
| M30*800 long grade 4.6 | 150 | 310 |
| M24*880 long grade 8.8 | 150 | 425 |
| M30*1220 long grade 8.8 | 150 | 850 |
| M36*1200 long grade 8.8 | 175 | 1450 |
| M36*1350 long grade 8.8 | 175 | 1450 |
| M36*1590 long grade 8.8 | 175 | 1450 |
| M42*1700 long grade 8.8 | 210 | 2350 |
| M48*1870 long grade 8.8 | 210 | 3500 |

Glossary of foundation reference codes

The foundation reference codes on the following pages are put together like this:

Standard-mass concrete: passive and non-passive foundations

We offer two standard concrete types for non-reinforced-mass foundation designs – passive and non-passive.

Passive concrete foundation Standard sizes

Non-passive concrete foundation Standard sizes

| Foundation | O.T.M (kNm) | Bearing pressure (kN/m²) | A Width (mm) | B depth (mm) |
|------------|-------------|--------------------------------|-----------------|-----------------|
| 3P150 | 3 | 150 | 650 | 750 |
| 4P150 | 4 | 150 | 700 | 800 |
| 5P150 | 5 | 150 | 750 | 800 |
| 6P150 | 6 | 150 | 750 | 900 |
| 8P150 | 8 | 150 | 850 | 950 |
| 10P150 | 10 | 150 | 900 | 950 |
| 15P150 | 15 | 150 | 950 | 1100 |
| 20P150 | 20 | 150 | 1050 | 1200 |
| 30P150 | 30 | 150 | 1200 | 1250 |
| 40P150 | 40 | 150 | 1250 | 1300 |
| 50P150 | 50 | 150 | 1350 | 1400 |
| 75P150 | 75 | 150 | 1450 | 1600 |
| 100P150 | 100 | 150 | 1600 | 1700 |
| 150P150 | 150 | 150 | 1800 | 1850 |
| 200P150 | 200 | 150 | 1950 | 2000 |
| 300P150 | 300 | 150 | 2250 | 2150 |
| 400P150 | 400 | 150 | 2450 | 2250 |
| 500P150 | 500 | 150 | 2700 | 2300 |
| 750P150 | 750 | 150 | 3050 | 2600 |

Ground bearing pressures below 150 kN/m² are not applicable.

Passive concrete Typically used in firm ground with ground-bearing pressure of no less than 150kN/m²

Soil pressure distribution

Non-passive concrete Typically used with uniform or poor subsoil with ground-bearing pressure of 75-150kN/m²

Soil pressure distribution

| Foundation | O.T.M (kNm) | Bearing pressure (kN/m²) | A Width (mm) | B depth (mm) |
|------------|----------------|--------------------------------|-----------------|-----------------|

Notes:

1. Concrete to have a minimum characteristic strength of 35 N/mm² at 28 days. Minimum cement content to be 300Kg/m³ with a maximum water cement ratio of 0.60. Coarse aggregate size to be 20mm nominal.

2. Reinforcement to be high-yield type 2 to BS4449 – minimum yield strength to be 485N/mm². Cover reinforcement to be 40mm.

3. Links to column section to be H10@200 c/c - shape code 51 to BS8666: 2005-plus H10 internal lacers at 450 max centres horizontal and 250 centres vertical shape code 99.

4. Above table is based on the water table being below the base of the foundation.

50mm blinding
